

HouseHunt – Finding Your Perfect Rental Home

A Complete Project Report (MERN Stack Application)

Developed By:

Gandla Harshitha

Academic Year: 2025-2026

1. Introduction

HouseHunt is a full-stack web application developed using the MERN stack (MongoDB, Express.js, React.js, Node.js). The system is designed to simplify the rental housing process by providing a secure and scalable digital platform. It supports user authentication, role-based authorization, property listing management, and database integration. The application ensures secure password storage using bcrypt hashing and implements JWT-based authentication. The frontend is built using React.js with component-based architecture for reusability and scalability. The backend provides RESTful APIs for data communication between client and server. MongoDB is used as a NoSQL database to efficiently manage user and property data. The project follows software engineering principles including requirement analysis, system design, development, testing, and deployment. Extensive testing was performed to ensure reliability, performance, and security. Future enhancements include payment gateway integration, advanced filtering, and deployment on cloud platforms.

3. Existing System

HouseHunt is a full-stack web application developed using the MERN stack (MongoDB, Express.js, React.js, Node.js). The system is designed to simplify the rental housing process by providing a secure and scalable digital platform. It supports user authentication, role-based authorization, property listing management, and database integration. The application ensures secure password storage using bcrypt hashing and implements JWT-based authentication. The frontend is built using React.js with component-based architecture for reusability and scalability. The backend provides RESTful APIs for data communication between client and server. MongoDB is used as a NoSQL database to efficiently manage user and property data. The project follows software engineering principles including requirement analysis, system design, development, testing, and deployment. Extensive testing was performed to ensure reliability, performance, and security. Future enhancements include payment gateway integration, advanced filtering, and deployment on cloud platforms.

The project follows software engineering principles including requirement analysis, system design, development, testing, and deployment. Extensive testing was performed to ensure reliability, performance, and security. Future enhancements include payment gateway integration, advanced filtering, and deployment on cloud platforms.

HouseHunt is a full-stack web application developed using the MERN stack (MongoDB, Express.js, React.js, Node.js). The system is designed to simplify the rental housing process by providing a secure and scalable digital platform. It supports user authentication, role-based authorization, property listing management, and database integration. The application ensures secure password storage using bcrypt hashing and implements JWT-based authentication. The frontend is built using React.js with component-based architecture for reusability and scalability. The backend provides RESTful APIs for data communication between client and server. MongoDB is used as a NoSQL database to efficiently manage user and property data. The project follows software engineering principles including requirement analysis, system design, development, testing, and deployment. Extensive testing was performed to ensure reliability, performance, and security. Future enhancements include payment gateway integration, advanced filtering, and deployment on cloud platforms.

10. Module Description

HouseHunt is a full-stack web application developed using the MERN stack (MongoDB, Express.js, React.js, Node.js). The system is designed to simplify the rental housing process by providing a secure and scalable digital platform. It supports user authentication, role-based authorization, property listing management, and database integration. The application ensures secure password storage using bcrypt hashing and implements JWT-based authentication. The frontend is built using React.js with component-based architecture for reusability and scalability. The backend provides RESTful APIs for data communication between client and server. MongoDB is used as a NoSQL database to efficiently manage user and property data. The project follows software engineering principles including requirement analysis, system design, development, testing, and deployment. Extensive testing was performed to ensure reliability, performance, and security. Future enhancements include payment gateway integration, advanced filtering, and deployment on cloud platforms.

HouseHunt is a full-stack web application developed using the MERN stack (MongoDB, Express.js, React.js, Node.js). The system is designed to simplify the rental housing process by providing a secure and scalable digital platform. It supports user authentication, role-based authorization, property listing management, and database integration. The application ensures secure password storage using bcrypt hashing and implements JWT-based authentication. The frontend is built using React.js with component-based architecture for reusability and scalability. The backend provides RESTful APIs for data communication between client and server. MongoDB is used as a NoSQL database to efficiently manage user and property data. The project follows software engineering principles including requirement analysis, system design, development, testing, and deployment. Extensive testing was performed to ensure reliability, performance, and security. Future enhancements include payment gateway integration, advanced filtering, and deployment on cloud platforms.

Extensive testing was performed to ensure reliability, performance, and security. Future enhancements include payment gateway integration, advanced filtering, and deployment on cloud platforms.

HouseHunt is a full-stack web application developed using the MERN stack (MongoDB, Express.js, React.js, Node.js). The system is designed to simplify the rental housing process by providing a secure and scalable digital platform. It supports user authentication, role-based authorization, property listing management, and database integration. The application ensures secure password storage using bcrypt hashing and implements JWT-based authentication. The frontend is built using React.js with component-based architecture for reusability and scalability. The backend provides RESTful APIs for data communication between client and server. MongoDB is used as a NoSQL database to efficiently manage user and property data. The project follows software engineering principles including requirement analysis, system design, development, testing, and deployment. Extensive testing was performed to ensure reliability, performance, and security. Future enhancements include payment gateway integration, advanced filtering, and deployment on cloud platforms.

The system is designed to simplify the rental housing process by providing a secure and scalable digital platform. It supports user authentication, role-based authorization, property listing management, and database integration. The application ensures secure password storage using bcrypt hashing and implements JWT-based authentication. The frontend is built using React.js with component-based architecture for reusability and scalability. The backend provides RESTful APIs for data communication between client and server. MongoDB is used as a NoSQL database to efficiently manage user and property data. The project follows software engineering principles including requirement analysis, system design, development, testing, and deployment. Extensive testing was performed to ensure reliability, performance, and security. Future enhancements include payment gateway integration, advanced filtering, and deployment on cloud platforms.

HouseHunt is a full-stack web application developed using the MERN stack (MongoDB, Express.js, React.js, Node.js). The system is designed to simplify the rental housing process by providing a

secure and scalable digital platform. It supports user authentication, role-based authorization, property listing management, and database integration. The application ensures secure password storage using bcrypt hashing and implements JWT-based authentication. The frontend is built using React.js with component-based architecture for reusability and scalability. The backend provides RESTful APIs for data communication between client and server. MongoDB is used as a NoSQL database to efficiently manage user and property data. The project follows software engineering principles including requirement analysis, system design, development, testing, and deployment. Extensive testing was performed to ensure reliability, performance, and security. Future enhancements include payment gateway integration, advanced filtering, and deployment on cloud platforms.

HouseHunt is a full-stack web application developed using the MERN stack (MongoDB, Express.js, React.js, Node.js). The system is designed to simplify the rental housing process by providing a

secure and scalable digital platform. It supports user authentication, role-based authorization, property listing management, and database integration. The application ensures secure password storage using bcrypt hashing and implements JWT-based authentication. The frontend is built using React.js with component-based architecture for reusability and scalability. The backend provides RESTful APIs for data communication between client and server. MongoDB is used as a NoSQL database to efficiently manage user and property data. The project follows software engineering principles including requirement analysis, system design, development, testing, and deployment. Extensive testing was performed to ensure reliability, performance, and security. Future enhancements include payment gateway integration, advanced filtering, and deployment on cloud platforms.

HouseHunt is a full-stack web application developed using the MERN stack (MongoDB, Express.js, React.js, Node.js). The system is designed to simplify the rental housing process by providing a secure and scalable digital platform. It supports user authentication, role-based authorization, property listing management, and database integration. The application ensures secure password storage using bcrypt hashing and implements JWT-based authentication. The frontend is built using React.js with component-based architecture for reusability and scalability. The backend provides RESTful APIs for data communication between client and server. MongoDB is used as a NoSQL database to efficiently manage user and property data. The project follows software engineering principles including requirement analysis, system design, development, testing, and deployment. Extensive testing was performed to ensure reliability, performance, and security. Future enhancements include payment gateway integration, advanced filtering, and deployment on cloud platforms.

25. Conclusion

HouseHunt is a full-stack web application developed using the MERN stack (MongoDB, Express.js, React.js, Node.js). The system is designed to simplify the rental housing process by providing a secure and scalable digital platform. It supports user authentication, role-based authorization, property listing management, and database integration. The application ensures secure password storage using bcrypt hashing and implements JWT-based authentication. The frontend is built using React.js with component-based architecture for reusability and scalability. The backend provides RESTful APIs for data communication between client and server. MongoDB is used as a NoSQL database to efficiently manage user and property data. The project follows software engineering principles including requirement analysis, system design, development, testing, and deployment. Extensive testing was performed to ensure reliability, performance, and security. Future enhancements include payment gateway integration, advanced filtering, and deployment on cloud platforms.

HouseHunt is a full-stack web application developed using the MERN stack (MongoDB, Express.js, React.js, Node.js). The system is designed to simplify the rental housing process by providing a secure and scalable digital platform. It supports user authentication, role-based authorization, property listing management, and database integration. The application ensures secure password storage using bcrypt hashing and implements JWT-based authentication. The frontend is built using React.js with component-based architecture for reusability and scalability. The backend provides RESTful APIs for data communication between client and server. MongoDB is used as a NoSQL database to efficiently manage user and property data. The project follows software engineering principles including requirement analysis, system design, development, testing, and deployment. Extensive testing was performed to ensure reliability, performance, and security. Future enhancements include payment gateway integration, advanced filtering, and deployment on cloud platforms.

HouseHunt is a full-stack web application developed using the MERN stack (MongoDB, Express.js, React.js, Node.js). The system is designed to simplify the rental housing process by providing a secure and scalable digital platform. It supports user authentication, role-based authorization, property listing management, and database integration. The application ensures secure password storage using bcrypt hashing and implements JWT-based authentication. The frontend is built using React.js with component-based architecture for reusability and scalability. The backend provides RESTful APIs for data communication between client and server. The application ensures secure password storage using bcrypt hashing and implements JWT-based authentication. The frontend is built using React.js with component-based architecture for reusability and scalability. The backend provides RESTful APIs for data communication between client and server. MongoDB is used as a NoSQL database to efficiently manage user and property data. The project follows software engineering principles including requirement analysis, system design, development, testing, and deployment. Extensive testing was performed to ensure reliability, performance, and security. Future enhancements include payment gateway integration, advanced filtering, and deployment on cloud platforms.

HouseHunt is a full-stack web application developed using the MERN stack (MongoDB, Express.js, React.js, Node.js). The system is designed to simplify the rental housing process by providing a secure and scalable digital platform. It supports user authentication, role-based authorization, property listing management, and database integration. The application ensures secure password storage using bcrypt hashing and implements JWT-based authentication. The frontend is built using React.js with component-based architecture for reusability and scalability. The backend provides RESTful APIs for data communication between client and server.
